

Syneco Systems, Inc. founded in 1983 is the manufacturer of odor control equipment, including dry air scrubbers, media, odor control manhole scrubbers, vent scrubbers and inflow protector inserts along with chemical and biological products. Our products are used primarily in municipal and industrial wastewater collection system pump stations, manholes and wastewater treatment plants.

PEACEMAKER® Dry Air Scrubbers Are used as a single vessel, two vessels in series or two vessels in parallel. The scrubbers provide two stages of media for the control of hydrogen sulfide (H_2S), and other odors generated in wastewater collection systems, manholes and lift stations along with controlling various point source odors present in wastewater treatment plants. Our scrubbers are maintenance free, effective, economic and require no chemical addition.

PERSNICKETY® Media Converting/Polishing media is impregnated with a patented polymeric amine and is used in high H_2S conditions. Oxidizing/Polishing media is impregnated with Chlorine Dioxide and is used in low H_2S conditions. Disposal is not an issue when the media is changed out as recommended by the manufacturer.

PEACEMAKER® Odor Control Manhole Scrubbers Provide control of H_2S and other odors while allowing generous venting through PERSNICKETY® H_2S converting or oxidizing media. Our custom made ABS plastic manhole scrubber inserts are effective, economic, easily installed by one person and require no maintenance.

PEACEMAKER® Odor Control Vent Scrubbers Nearly all vent stacks suffer from odor problems, whether in homes, small lift stations, or commercial buildings. The problem is mostly ignored or ineffectively treated with activated carbon filters. PERSNICKETY® Vent Scrubbers are very economic and convenient as they do not require replacement and Persnickety® media can be replaced as necessary.

PEACEMAKER® Inflow Protector Inserts With municipal sewage treatment costs rising, one of the ways many cities are cutting their sewer costs is to eliminate rainwater from the sanitary sewer system by using our patented Inflow Protector Manhole Inserts. These inserts are made from ABS plastic and are easily installed by one person.

PERSNICKETY® Brand Chemicals We offer two different odor control chemicals: odor countervailants and odor neutralizers. Our chemicals are used in scrubbers, ponds, sludges and as a topical spray in municipal and industrial wastewater treatment facilities.

PERSNICKETY® Brand 713 Biological Inoculant Facultative anaerobic natural occurring bacteria used for control of H_2S in open ponds, tanks, lagoons, collection lines and wastewater treatment plants. The bacteria is cultured to reduce H_2S to elemental sulfur eliminating the toxicity of H_2S creating a healthy environment for the normally present microbes.
